The goal of The Children’s Hospice Infield, Holland is to provide complex care to seriously and terminally ill children with a limited life expectancy.

The Kinderhospice Binnenveld has recently completed a large scale building to better cope with a growing number of children needing care.

“The comfort for this hospice should be felt within not only the care provided but also in the environment and equipment used.”

The transformation of the Children’s Hospice began in 2012, built around the experiences of the Children’s growing needs. The new location has 12 rooms allowing for an additional 30 children per year to be cared for. Ceiling Hoists are an integral part of the design and are throughout the new building.

Multiple gate or “turning systems” have been fitted to meet the requirements for children in each bedroom without the need to unhook the hoist

OpeMed designed the optimum ceiling track to maximise efficiency, smoothness and safety whilst minimising patient transfer time

The new ceiling track and carefully selected OT200 Hoists enable the Hospice to offer complex and intensive care to meet the needs of each individual child.

The Hospice opened its doors on 15th April, Director of the Hospice Wilma Stoelinga commented;

"...In our case the child is much more than his illness. And how do you deal with a child with an uncertain life? Where we can contribute? It is not only medical care we provide, but also psychosocial, educational and pastoral care. Comfort is therefore a starting point."

Comfort was the basis of understanding when choosing to work with OpeMed products at Infield Hospice.

OpeMed are able to provide a professional and honest perspective on selecting equipment that is comfortable for the user and right for the carer too.
